[ $m, a > 0$ ]. [См. 851.1.]

Значительная доля интегралов в 850—865 может быть найдена в [6]. См. также [3]—[7].

866.01.  $\int_0^{\pi} \cos(x \sin \varphi) d\varphi = \int_0^{\pi} \cos(x \cos \varphi) d\varphi = \pi J_0(x).$

866.02.  $\int_0^{\pi} \cos(n\varphi - x \sin \varphi) d\varphi = \pi J_n(x),$

где  $n$  — нуль или целое положительное число.

(Интегралы Бесселя.)

866.03.  $\int_0^{\pi} e^{p \cos x} dx = \pi I_0(p),$  как в 809.1.

Таблицы к 866 см. [20] и [21].

880. Правило Симпсона. Если известны значения  $y = f(x)$  для равноотстоящих значений  $x$  с шагом  $h$ , то численное значение интеграла приближенно выражается формулой:

$$\int_a^b f(x) dx \approx \frac{h}{3} [y_0 + 4y_1 + 2y_2 + 4y_3 + 2y_4 + \dots + 4y_{2n-1} + y_{2n}],$$

где  $h = x_1 - x_0$  — постоянная разность между соседними значениями  $x$ , т. е.  $2nh = b - a$ . Коэффициенты равны поочередно 4 или 2, как указано. Приближение обычно тем точнее, чем больше  $n$ . Таким методом можно получить численный результат, когда аналитическое выражение для интеграла не может быть найдено. Используя таблицу  $f(x)$  и арифмометр, можно провести это вычисление без промежуточных записей.

881. Погрешность приведенной выше приближенной формулы равна

$$\frac{nh^5 f^{IV}(x)}{90} = \frac{(b-a) h^4 f^{IV}(x)}{180},$$

где для оценки величины  $h^4 f^{IV}(x)$  может быть взята наибольшая четвертая разность в интервале  $(a, b)$ .

882. Другая формула, которая во многих случаях более точна, чем формула 880. По ней тоже можно производить вычисление на арифмометре без промежуточных записей:

$$\int_a^b f(x) dx \approx \frac{h}{4,5} [1,4y_0 + 6,4y_1 + 2,4y_2 + 6,4y_3 + 2,8y_4 + \\ + 6,4y_5 + 2,4y_6 + 6,4y_7 + 2,8y_8 + \dots + \\ + 6,4y_{4n-3} + 2,4y_{4n-2} + 6,4y_{4n-1} + 1,4y_{4n}],$$

где  $4nh = b - a$ .
